

Use-Case Flow Specification

Use Case: Configure Percentage Rollout

Who's involved: Software Engineer or Release Manager

What it's for: Controlling how many users see a new feature while it's rolling out gradually.

Before you start

- The feature flag needs to already exist.
- You'll need a user cohort ready to go.
- Whoever's making the change needs permission to touch rollout settings.

What happens after

- The rollout percentage gets saved.
- From then on, the feature flag uses that percentage for the selected users.

How it normally goes

1. The engineer or release manager picks which feature to roll out.
2. The system shows them the current percentage and who's in the cohort.
3. They type in a number — 10%, say.
4. The system checks if that number actually makes sense.
5. It gets applied to the cohort.
6. The flag gets evaluated for those users.
7. The setting gets saved.
8. They get a confirmation that it worked.

If the percentage doesn't check out

- 4a1. Say someone types in -5% or 150% — the system catches that at step 4.
- 4a2. It throws an error and doesn't apply anything.
- 4a3. They fix the number.
- 4a4. Back to step 4, business as usual.
